Bali Sculptures

Time limit: 1000 ms

Memory limit: 65536 KB

Description

The province of Bali has many sculptures located on its roads. Let's focus on one of its main roads.

There are N sculptures on that main road, conveniently numbered 1 through N consecutively. The age of sculpture i is Y_i years. To make the road more beautiful, the government wants to partition the sculptures into several groups. Then, the government will plant beautiful trees between the groups, to attract more tourists to Bali.

Here is the rule in partitioning the sculptures:

- The sculptures must be partitioned into exactly X groups, where $A \le X \le B$. Each group must consist of at least one sculpture. Each sculpture must belong to exactly one group. The sculptures in each group must be <u>consecutive</u> sculptures on the road.
- For each group, compute the sum of the ages of the sculptures in that group.
- Finally, compute the bitwise OR of the above sums. Let's call this the final beauty value of the partition.

What is the minimum final beauty value that the government can achieve?

Note: the bitwise OR of two non-negative integers P and Q is computed as follows:

- Convert P and Q into binary.
- Let nP = number of bits of P, and nQ = number of bits of Q. Let M = max(nP, nQ).
- Represent P in binary as $p_{M-1}p_{M-2} .. p_1p_0$ and Q in binary as $q_{M-1}q_{M-2} .. q_1q_0$, where p_i and q_i are the i-th bits of p and q, respectively. The (M-1)st bits are the most significant bits, while the 0th bits are the least significant bits.
- P OR Q, in binary, is defined as $(p_{M-1}$ OR $q_{M-1})(p_{M-2}$ OR $q_{M-2})..(p_1$ OR $q_1)(p_0$ OR q0), where
  - 0 OR 0 = 0
  - 0 OR 1 = 1
  - 1 OR 0 = 1
  - 1 OR 1 = 1

Input Format

The first line contains three space-separated integers N, A, and B. The second line contains N space-separated integers $Y_1, Y_2, ..., Y_N$.

Output Format

A single line containing the minimum final beauty value.

Sample Input

```
6 1 3
8 1 2 1 5 4
```

Sample Output

```
11
```

Explanation

Partition the sculptures into 2 groups: (8 1 2) and (1 5 4). The sums are (11) and (10). The final beauty value is (11 OR 10) = 11.

Subtasks

Subtask 1 (9 points)

- $1 \le N \le 20$
- $1 \le A \le B \le N$
- $0 \le Y_i \le 1,000,000,000$

Subtask 2 (16 points)

- $1 \le N \le 50$
- $1 \le A \le B \le \min(20, N)$
- $0 \le Y_i \le 10$

Subtask 3 (21 points)

- $1 \le N \le 100$
- $A = 1$
- $1 \le B \le N$
- $0 \le Y_i \le 20$

Subtask 4 (25 points)

- $1 \le N \le 100$
- $1 \le A \le B \le N$
- $0 \le Y_i \le 1,000,000,000$

Subtask 5 (29 points)

- $1 \le N \le 2,000$
- $A = 1$
- $1 \le B \le N$
- $0 \le Y_i \le 1,000,000,000$

Jakarta Skyscrapers

Time limit: 1000 ms

Memory limit: 262144 KB

Description

The city of Jakarta has N skyscrapers located on a line, conveniently numbered 0 through N-1 from left to right. There are no other skyscrapers in Jakarta.

Jakarta is inhabited by M mystical creatures called "**doge**"s. The doges are conveniently numbered 0 through M-1. Doge i initially resides in skyscraper B_i. Doge i has a mystical power, represented with a positive integer P_i. This mystical power enables doges to jump between skyscrapers. In a single jump, a doge with superpower p that is currently in skyscraper b can move to either skyscraper b+p (if $0 \leq$ b+p < N) or skyscraper b-p (if $0 \leq$ b-p < N).

Doge 0 is the most awesome doge, and it is the leader of all the doges. It has an urgent news for doge 1, and wants the news to reach doge 1 as quickly as possible. Any doge that has received the news can do any of the following actions:

- Make a jump to move to some other skyscraper.
- Pass the news to another doge in the same skyscraper.

Please help the doges by calculating the minimum number of total jumps required by all doges to pass the news to doge 1, or if it is impossible to do so.

Input Format

The first line contains two integers N and M. Each of the next M lines contains two integers B_i and P_i.

Output Format

A single line containing the minimum number of total jumps, or -1 if it is impossible.

Sample Input

```
5 3
0 2
1 1
4 1
```

Sample Output

```
5
```

Explanation

Here is one of the possible scenarios to pass the news using 5 jumps:

- Doge 0 jumps to skyscraper 2 and then to skyscraper 4 (2 jumps).
- Doge 0 passes the news to doge 2.
- Doge 2 jumps to skyscraper 3, and then to skyscraper 2, and then to skyscraper 1 (3 jumps).
- Doge 2 passes the news to doge 1.

Subtasks

For each subtask,

- $0 \le B_i < N$

Subtask 1 (10 points)

- $1 \le N \le 10$
- $1 \le P_i \le 10$
- $2 \le M \le 3$

Subtask 2 (12 points)

- $1 \le N \le 100$
- $1 \le P_i \le 100$
- $2 \le M \le 2{,}000$

Subtask 3 (14 points)

- $1 \le N \le 2{,}000$
- $1 \le P_i \le 2{,}000$
- $2 \le M \le 2{,}000$

Subtask 4 (21 points)

- $1 \le N \le 2{,}000$
- $1 \le P_i \le 2{,}000$
- $2 \le M \le 30{,}000$

Subtask 5 (43 points)

- $1 \le N \le 30{,}000$
- $1 \le P_i \le 30{,}000$
- $2 \le M \le 30{,}000$

Palembang Bridges

Time limit: 2000 ms

Memory limit: 262144 KB

Description

The city of Palembang is separated by Musi River into two zones. Let's call them zone A and zone B.

Each zone consists of exactly 1,000,000,001 buildings along the respective side of the river, conveniently numbered 0 through 1,000,000,000. The distance between every pair of adjacent buildings is 1 unit of distance. The width of the river is 1 unit of distance as well. Building i in zone A is located on exactly the opposite side of building i in zone B.

N citizens live and work in the city. Citizen i's house is in zone P_i, building S_i, while his office is in zone Q_i, building T_i. If a citizen must cross the river to go from his house to his office, he must take a boat. This has been uncomfortable, so the government has decided to build at most K bridges over the river, so that the citizens can go to work by driving. The bridges must be strictly perpendicular to the river. The bridges must not overlap each other.

Let D_i be the **minimum** distance citizen i has to drive to go from his house to his office, after the government has built at most K bridges. Help the government build the bridges in such a way that the sum $D_1 + D_2 + ... + D_N$ is minimized.

Input Format

The first line contains two integers K and N. Each of the next N lines contains four tokens P_i, S_i, Q_i, and T_i.

Output Format

A single line containing the minimum sum of the distances.

Sample Input 1

```
1 5
B 0 A 4
B 1 B 3
A 5 B 7
B 2 A 6
B 1 A 7
```
Sample Output 1

```
24
```

Sample Input 2

```
2 5
B 0 A 4
B 1 B 3
A 5 B 7
B 2 A 6
B 1 A 7
```
## Sample Output 2

```
22
```

Explanation

This is the illustration for both sample inputs.

Here is one possible solution for sample input 1. The pink stripe segment denotes a bridge.

And this is a possible solution for sample input 2:

Subtasks

For each subtask,

- P_i and Q_i will be either a character 'A' or a character 'B'.
- $0 \le S_i, T_i \le 1{,}000{,}000{,}000$
- More than one house or office (or combination of both) can be located in the same building.

Subtask 1 (8 points)

- $K = 1$
- $1 \le N \le 1{,}000$

Subtask 2 (14 points)

- $K = 1$
- $1 \le N \le 100{,}000$

Subtask 3 (9 points)

- $K = 2$
- $1 \le N \le 100$

Subtask 4 (32 points)

- $K = 2$
- $1 \le N \le 1{,}000$

Subtask 5 (37 points)

- $K = 2$
- $1 \le N \le 100{,}000$
